

Homework 3

Problem 1

$3^{220} \bmod 221 = 55$ following our modulus exponentiation algorithm. $220_{10} = 11011100_2$

$Z=1$

$W=3$

$b_0=0$

$Z=1$

$W=(3*3) \bmod 221=9$

$b_1=0$

$Z=1$

$W=(9*9) \bmod 221=81$

$b_2=1$

$Z=(1*81) \bmod 221=81$

$W=(81*81) \bmod 221=152$

$b_3=1$

$Z=(81*152) \bmod 221=157$

$W=(152*152) \bmod 221=120$

$b_4=1$

$Z=(157*120) \bmod 221=55$

$W=(120*120) \bmod 221=35$

$b_5=0$

$Z=55$

$W=(35*35) \bmod 221=120$

$b_6=1$

$Z=(55*120) \bmod 221=191$

$W=(120*120) \bmod 221=35$

$b_7=1$

$Z=(191*35) \bmod 221=55$

$W=(35*35) \bmod 221=120$

55

Problem 2

$3^{101} + 8^{101}$ is evenly divisible by 11.

$Z=1$ $W=3$ $b_0=1$ $Z=(1*3)\text{mod}11=3$ $W=(3*3)\text{mod}11=9$ $b_1=0$ $Z=3$ $W=(9*9)\text{mod}11=4$ $b_2=1$ $Z=(3*4)\text{mod}11=1$ $W=(4*4)\text{mod}11=5$ $b_3=0$ $Z=1$ $W=(5*5)\text{mod}11=3$ $b_4=0$ $Z=1$ $W=(3*3)\text{mod}11=9$ $b_5=1$ $Z=(1*9)\text{mod}11=9$ $W=(9*9)\text{mod}11=4$ $b_6=1$ $Z=(9*4)\text{mod}11=3$ $W=(4*4)\text{mod}11=5$ 3 Thus, $3^{101}\text{mod}11 = 3$	$Z=1$ $W=8$ $b_0=1$ $Z=(1*8)\text{mod}11=8$ $W=(8*8)\text{mod}11=9$ $b_1=0$ $Z=8$ $W=(9*9)\text{mod}11=4$ $b_2=1$ $Z=(8*4)\text{mod}11=10$ $W=(4*4)\text{mod}11=5$ $b_3=0$ $Z=10$ $W=(5*5)\text{mod}11=3$ $b_4=0$ $Z=10$ $W=(3*3)\text{mod}11=9$ $b_5=1$ $Z=(10*9)\text{mod}11=2$ $W=(9*9)\text{mod}11=4$ $b_6=1$ $Z=(2*4)\text{mod}11=8$ $W=(4*4)\text{mod}11=5$ 8 Thus, $8^{101}\text{mod}11 = 8$
---	---

Based on the substitution rule of modular congruence which says if for integers A, B, C, D, N, if $A \equiv C \pmod{N}$ and $B \equiv D \pmod{N}$, then $A+B \equiv C+D \pmod{N}$. I have shown that $3^{101} \equiv 3 \pmod{11}$ and that $8^{101} \equiv 8 \pmod{11}$. So $3^{101} + 8^{101} \equiv 3+8 \pmod{11}$ or $11 \pmod{11}$ which is 0 and $11 \mid 3^{101} + 8^{101}$ with no remainder.

Problem 3

The greatest common divisor of $x=392$ and $y=105$ can be calculated with Euclid's Algorithm.

$\text{gcd}(392, 105) = \text{gcd}(105, 392 \bmod 105) = \text{gcd}(105, 77) = \text{gcd}(77, 105 \bmod 77) = \text{gcd}(77, 28) = \text{gcd}(28, 77 \bmod 28) = \text{gcd}(28, 21) = \text{gcd}(21, 28 \bmod 21) = \text{gcd}(21, 7) = \text{gcd}(7, 21 \bmod 7) = \text{gcd}(7, 0) \rightarrow$ thus 7 is the greatest common divisor of both 392 and 105.

Part 1.

Does $105^{-1} \bmod 392$ exist? $\text{gcd}(392, 105) = 7$. Thus 392 and 105 are not relatively prime, so no inverse exists for $105^{-1} \equiv 1 \bmod 392$.

Part 2.

Since the greatest common divisor isn't 1 we can do this simply without using the extended Euclid's algorithm. $X = 105/7 = 15$. $\rightarrow 392y + 105 \cdot 15 = 7 \rightarrow 392y = 7 - 105 \cdot 15 \rightarrow y = (7 - 105 \cdot 15)/392 = -4$
Thus $105 \cdot 15 + (-4)392 = 7$. $X = 15$, and $Y = -4$.

Part 3.

According to Bezout's identity, the greatest common divisor of a and b is also the smallest positive linear combination of the form $ax + by = d$ where d is the greatest common divisor. Since the $\gcd(392, 105) = 7$ and $1 < 7$, there are no integers x , and y where $105x + 392y = 1$.
